*The margin of error is a way of expressing whether the number of responses from a nursing home was large enough to capture the entire range of opinions to each question or whether there was too much uncertainty because of a small number of responses. The margin of error measures the uncertainty of the estimates of "true" responses. The margin of error is calculated based on the size of a nursing home and the number of respondents as well as some other factors. If the margin of error (amount of uncertainty) was greater than 10%, we did not report results for a nursing home. The margin of error used to determine whether results should be reported is based on a 95% confidence interval. A 10% margin of error means that if 55% of respondents report being satisfied, the true value of satisfaction lies between 45% and 65%. The Statewide Average reflects those facilities that were open and met the margin of error for the survey (n=630).
